

Powerful visual product presentation
for the world wide web

TORNADO LITE AND TORNADO PRO

Tornado is a family of software for Microsoft Windows where you can import your product photos and merge them into 3D-like presentation which can be used directly on the internet. The photos taken should represent the portrayed object from 360 degrees divided on up to 36 images. Tornado is compatible with all common file formats.

Never before has it been possible to view an object from different angles on the Internet in a resolution that compares to the best possible printouts from originals taken with the best digital cameras.

AT THE HEART OF TORNADO

We have built Tornado based on parameters we thought were crucial in order to give you the best Internet product presentation in the world:

STANDARD FLASH

The final presentation is viewable in all standard Internet browsers for a vast majority of users around the world. This means that there is no need for downloading additional plugins in order to enjoy the presentation. The product is based on W3C validated formats, using Adobe Flash Player 9 and Actionscript 3.

NO RESTRICTIONS ON MAXIMUM SIZE ALLOWS FOR EXTREME ZOOM LEVELS

Tornado has the power to provide a no-limits level of detail, since there are no restrictions on the photo material's maximum size. Anything from small consumer cameras to D-SLR and high-end digital cameras are covered by the engine in Tornado.

This allows the user of the product to zoom in on the object to view it at an impressive 100 percent.

FAST VIEW

Even though the photographs behind a presentation can be extremely large (up to 36 pictures at 100 MB each) there is an impressively fast loading and viewing time due to the LOD2 System, especially developed for Tornado.

INTUITIVE USAGE

A simple and clean interface quickly gives the user a feeling of what is possible within a Tornado presentation.

A simple click zooms in on the object, and a click-drag moves the viewed area.

MEET THE FAMILY

Tornado comes in two different versions that both meet the requirements of Microsoft Windows 2000, XP and Vista.

They all run on standard PC hardware, and the output is ready for use directly on the Internet.
